

Mini Endoscopes

Semi-flexible

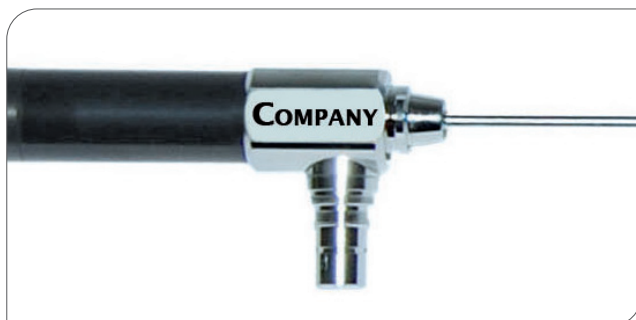

Suitable for several applications in the surgical specialties:

- Arthroscopy
- Sinuscopy
- Laparoscopy

The semi-flexible mini endoscopes perfectly cover those fields where accessibility is difficult and space limited. Best examples are small joint arthroscopy or the access of blocked sinuses. In laparoscopy the mini endoscopes are used for special applications. E.g. for a view into the abdomen right from the first puncture the mini endoscopes can be used with a special optical veress needle. The semi-flexible mini endoscopes with high resolution image bundles are less prone to break due to their special construction, thereby considerably reducing repair expenses.

In combination with a FlexiVision camera system and the video algorithm "grid removal", the honeycomb structure produced by image bundle endoscopes can be visibly reduced, therefore further enhancing the image quality.
